

Some Active Directory (AD) tasks are a snap. Like changing a user's street address. Something this simple just takes a minute, right? Now try changing the street address for each user in an entire division and suddenly you're canceling dinner plans—again. That's why you need ADtoolkit. With ADtoolkit, you can use the Search and Replace tool to change multiple user attributes in a single action. Or, you can use the Custom Tools wizard to deliver tools, and tasks like this, directly to your team. The tools included in ADtoolkit streamline the execution of common administrative tasks, giving you back the time you need for more advanced directory initiatives... or maybe you just want to keep those dinner plans!

ADtoolkit™ enables users to perform multiple AD tasks at once.

Designed for users who want to tackle AD chores in bulk, the toolkit streamlines the configuration and execution of common administrative tasks. Included are the following tools:

- Add Contacts, Users and Groups
- Analyze ACLs in AD and on Files and Shares
- Delete Contacts, Users, Groups
- Reporting Contacts, Users and Groups
- Reset Passwords
- Resynch Active Directory
- Search and Replace Contact, User and Group Attributes
- Search and Replace Access Control Lists (ACLs) in AD and on Files and Shares

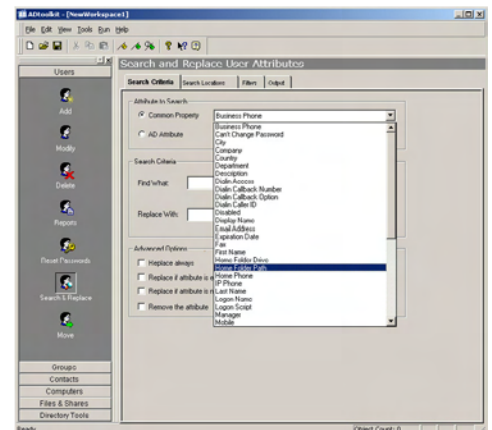

Take immediate action by importing saved reports.

Using the custom reporting feature easily enables you to construct and filter data in AD—completely eliminating the need for scripting solutions or third party databases. And, the report output can be imported back into other ADtoolkit tools, allowing you to take immediate action on any problems uncovered by the report. For example, a report is created to show users who have a Home Folder on an overloaded server A. Import this report into the Modify User tool, specifying the new Home Folder location on the faster server B, and select the option to copy the contents of the folder. By executing this task, the users identified in the report immediately have their Home Folder, and contents, relocated on the faster server B. Just look at your task list and see how many chores you'll complete using these advanced report and import features.

You'll never go back to scripting again.

Key Features

- Perform search and replace on user, group and contact data
- Add, delete and modify user, group and contact attributes and properties
- Move users, groups, contacts and computers in bulk
- Create, configure and delete Exchange mailboxes
- Clean up ACLs and remove deleted or unknown SIDs in AD and on Files and Shares
- Undo changes made to ACLs
- Search through ACLs to perform search and replace on group and user names
- Distribute customized tools to other admins
- Report on account data and resource usage for Users, Groups and Contacts
- Use report data to drive other tools
- Schedule tasks to run at your convenience
- Customize UI to mandate data entry on specific fields
- Launch pre-configured tools from desktop

ADtoolkit's Search and Replace tool allows administrators to find specific user data and easily change that information.
